Topic 3 : Core Node Workflow

Step 1: Create a New Workflow

1. Navigate to your n8n workspace.
2. In the **Workflows** dashboard, click **Add workflow** in the top right.
3. Name your new workflow: `Topic 3 Core Nodes Workflow`.
4. Click the orange **Save** button.

Step 2: Add and Configure the Manual Trigger Node

1. Click the **Add first step** button in the center of the canvas.
2. Search for `Manual` and add the **When clicking "Test workflow"** node.

Step 3: Add the First Edit Fields Node (Set Original Data)

We will use this node to create our original mock product data.

1. Click the output connector (+ icon) of the **Manual Trigger** node.
2. Search for `Edit Fields` and select the **Edit Fields (Set)** node.
3. Double-click the node to open the configuration panel. Rename the node to `Set Original Data` by clicking the edit pencil next to the node name at the top of the panel.
4. Add the following three fields under the **Fields to Set** section:
    a. **Field 1 (String):**
        i. Click **Add Field** -> Select **String**.
        ii. **Name:** `productName`.
        iii. **Value:** `Wireless Mouse`
    b. **Field 2 (Number):**
        i. Click **Add Field** -> Select **Number**.
        ii. **Name:** `basePrice`
        iii. **Value:** `30`
    c. **Field 3 (Boolean):**
        i. Click **Add Field** -> Select **Boolean**.
        ii. **Name:** `isAvailable`
        iii. **Value:** Toggle to `true` (Enabled).
5. Close the panel.

Step 4: Run the First Node to Generate Input Data

Before mapping data in a second node, we must run the first node so n8n knows what fields are available to map.

1. Hover over the `Set Original Data` node and click the small play icon (**Test step**).
2. The node will turn green, and the output panel will display the three fields.

Step 5: Add the Second Edit Fields Node (Modify & Map)

1. Click the output connector (+ icon) of the `Set Original Data` node.
2. Search for `Edit Fields` and select a second **Edit Fields (Set)** node.
3. Rename this node to `Modify & Map`.
4. Open the configuration panel. By default, n8n passes all fields through, but we can modify and add to them:
    a. **Task A: Modify an existing field (`isAvailable`)**
        i. Click **Add Field** -> Select **Boolean**.
        ii. **Name:** Enter `isAvailable` (this MUST match the name of the incoming field exactly to overwrite it).
        iii. **Value:** Toggle to `false` (Disabled).
    b. **Task B: Map an incoming field value (`inventoryLabel`)**
        i. Click **Add Field** -> Select **String**.
        ii. **Name:** Type `inventoryLabel`.
        iii. **Value:** Instead of typing static text, we want to map the value from `productName`:
            1. On the left of the configuration panel, you will see the **INPUT** schema list showing `productName: "Wireless Mouse"`.
            2. Drag `productName` from the input list and drop it directly into the **Value** text box of your new `inventoryLabel` field.
            3. The value box will display the expression: `{{ $json.productName }}`.
    c. **Task C: Add a calculated field (`priceWithTax`)**
        i. Click **Add Field** -> Select **Number**.
        ii. **Name:** Type `priceWithTax`.
        iii. **Value:** We want to multiply the incoming `basePrice` by `1.1` (10% tax):
            1. Drag `basePrice` from the **INPUT** list into the value text box (it writes `{{ $json.basePrice }}`).
            2. Click inside the value box, delete the outer closing curly braces of the expression, and append `* 1.1`.
            3. The final expression in the box should read exactly: `{{ $json.basePrice * 1.1 }}`.
5. Close the panel.

Step 6: Test and Verify the Final Output

1. Click the orange **Test workflow** button.
2. Once executed successfully, double-click the `Modify & Map` node and inspect the **Output** tab in JSON mode.
3. The resulting JSON output should look exactly like this:

```
[
  {
    "productName": "Wireless Mouse",
    "basePrice": 30,
    "isAvailable": false,
    "inventoryLabel": "Wireless Mouse",
    "priceWithTax": 33
  }
]
```
